Spectrum Economics

USTTI RF Spectrum Management Course September 18, 2019

> Giulia McHenry – FCC Giulia.McHenry@fcc.gov

Spectrum is a Limited Resource

Spectrum Value

- Spectrum is an <u>input</u> for the provision of wireless services, to support commercial services, public uses and even private purposes.
- Several types of spectrum value derived from services
 - Economic value of license is equal to the present value of profits from services delivered by spectrum
 - Economic and social value enabled by the spectrum are difficult to measure
- Scarcity (finite nature) of spectrum and value of wireless services leads to high market value and demand for spectrum

Escalating Demand and Value

- Wireless communications and broadband have dramatically increased demand for spectrum
- Up until 25 years ago
 - Less congestion in the airwaves
 - Relatively few commercial applications
 - Broadcasting TV, radio
 - Satellite
- Emergence of higher valued spectrum-based services (e.g. wireless broadband) increased value

Increasing Demand is Certain

- Surging demand for spectrum-based services
 By 2021…
 - 5.5 billion global mobile users, up from 4.9 billion in 2016
 - 63 percent of mobile data traffic will be offloaded
 - By 2023...
 - Mobile data traffic grow at compound annual rate of 42%
 - Mobile traffic will group 8-fold from 2017
- More uses and users imply more scarcity
 - Licensed broadband services
 - Unlicensed / licensed-exempt (i.e. Wi-Fi) services
 - Public sector/government services
 - Emergency response, crime prevention, aviation, weather satellite, defense, space exploration, etc.

Increasing Spectrum Supply

- Demand and scarcity driving search for more usable spectrum and intensity of use
- Advances in 5G are increasing effective supply of spectrum for wireless broadband
 - Increasing opportunities above 3 GHz, especially millimeter wave
 - Increasing opportunities for sharing
 - Increasing potential of unlicensed spectrum

Maximizing Spectrum Value

- With explosive growth in mobile communications, industry and governments appreciate economic value of spectrum
 - Enables economic activity, growth and innovation
 - Critical to profitability of mobile industry
 - Creates revenues from sale of spectrum licenses
- Regulators face pressure to make spectrum available for commercial use and ensure government has spectrum necessary for operations

Maximizing Spectrum Value

- Policymakers' goal is to ensure that all spectrum is put to highest and best use
 - Balancing array of interests and users: commercial, government, public
 - Protecting incumbents and fostering innovation
- Two underlying questions
 - How to maximize economic and social benefits from spectrum (i.e., economic and social value)?
 - How should spectrum be managed?

Spectrum Management

- Spectrum management/assignment approaches have evolved with technology and notion of spectrum value
- Combination of approaches typically applied
 - Command and control of specific use rights
 - Market based trade of flexible use rights
 - Commons (unlicenced, rule-based)
- Several hybrid models also exist

Command and Control

- Regulator pre-determines service type and user(s)
 - Limits spectrum trading or repurposing
 - Fees sometimes assessed to recover administrative costs
- In U.S., still applied to historic uses and where competitive markets unlikely:
 - Broadcasting (historically, now limited trading)
 - Government users
 - Satellite earth stations
- Difficult to ensure spectrum put to highest valued use, so commercial spectrum will be less valuable
- Model may still be appropriate where markets unlikely, but there are social benefits to a service

Flexible Rights of Use

- Flexible use and market-based trade
 - Licensee determines use, subject to minimum technical requirements (i.e. technology neutrality)
 - Free to transfer spectrum to another user (and sometimes service) and keep profits
- Initial rights awarded through competitive bidding (auctions)
 - Payments may be lump sum or fee-based
 - Resale rights creates a secondary market for spectrum
- Flexibility allows spectrum to flow to users with highest value
- Examples:
 - Commercial mobile services
 - Other telecom services

Spectrum Commons

- Rule-based usage for all users who meet requirements
- Useful for applications where potential interference is low (i.e., short-range, low power), so exclusivity not necessary
- No exclusive right to spectrum implies no market value for spectrum, but may enable immense economic activity
 - Widely available, low cost technology
 - Opportunity for innovation
 - E.g., Wi-Fi, LTE-U, Bluetooth
- Challenge: Must allocate sufficient unlicensed spectrum to limit congestion and enable services, while balancing with other resource needs.

Drivers of Spectrum Value

- Net Profits From Deploying a Band of Spectrum are Determined by Four Broad Factors:
 - Net Profits = Revenues
 - Capitol expenditure
 - Operating expenditure
 - Cost of capital
- Two Additional Factors Determine the Present Value:
 - Timing of revenues and costs
 - Risk and uncertainty
- User's Willingness to Pay is Based on Relative Value of Alternative Assets (Lower Bound)

Drivers of Spectrum Value

- Value of a specific spectrum license likely to vary by a number of specific factors, including:
 - Frequency and associated technical characteristics
 - License rules, feasible services, certainty
 - Geography and size of coverage area
 - Availability of equipment: harmonization, similar bands
 - Spectrum supply (current and future)
 - Socioeconomic factors, including demographics, population density, income, political climate
 - Regulatory climate, including risks, costs of doing business
 - Other factors

Determining Spectrum Value

- To estimate value of <u>licensed commercial spectrum</u>, can apply combination of typical valuation techniques:
 - Discounted cash flows (DCF)
 - Market comparables
 - Cost savings DCF
 - Econometric modeling
- Nature of spectrum can make this very complex
- Only applies to licensed commercial spectrum. Excludes:
 - Economic activity enabled by spectrum (licensed and unlicensed)
 - Consumer welfare
 - Non-commercial uses (government, educational, other public)

Spectrum Enabled Value

- Spectrum based services also add value to economy
 - Equipment manufacturing/spending
 - Spending on unlicensed spectrum services/equipment
- Users of the services in turn create value and generate income contribute to Internet services/app economy
- Economic benefits enabled by unlicensed and licensed spectrum difficult to quantity. Proxies to consider:
 - Investments on R&D and equipment
 - End-user market revenues
 - Size of economies that use services

Public Sector and Social Value

- Public sector benefits even more difficult to quantify
- Countries take different approaches to ensuring sufficient spectrum available for government commercial. Examples:
 - U.S. sets aside specific spectrum allocations for government
 - Repurpose spectrum for commercial use as needed, compensating impacted government spectrum users
 - U.K. imposes market-based rates for public users, requiring that government pay market rates and access spectrum markets
 - Challenges to both approaches
- Many countries face question of how to incentivize public users to use spectrum "efficiently"

Thank you!
